**APPLICATION FOR
UNITED STATES LETTERS PATENT**

S P E C I F I C A T I O N

TO ALL WHOM IT MAY CONCERN:

Be it known that we, Geun Su LEE, a citizen of the Republic of Korea, residing at #103-302 Samick Apt., Bubal-eub, Shinha-ri, Ichon-shi, Kyongki-do 467-860, Republic of Korea, and Jae Chang JUNG, a citizen of the Republic of Korea, residing at #107-1304 Hyundai Apt., Sadong-ri, Daewol-myeon, Ichon-shi, Kyongki-do 467-850, Republic of Korea, and Ki Soo SHIN, a citizen of the Republic of Korea, residing at #307-1301 Kisan Apt., Yatop-2-dong, Bundang-gu, Sungnam-shi, Kyongki-do 463-070, Republic of Korea, have invented a new and useful PHOTORESIST MONOMERS, POLYMERS THEREOF AND PHOTORESIST COMPOSITIONS CONTAINING THE SAME, of which the following is a specification.

10054532.012202

PHOTORESIST MONOMERS, POLYMERS THEREOF AND PHOTORESIST COMPOSITIONS CONTAINING THE SAME

BACKGROUND

5 Technical Field

Novel photoresist monomers, polymers thereof and photoresist compositions containing the same are disclosed. In particular, photoresist monomers are disclosed which are suitable for a photolithography process using DUV (deep ultraviolet) light sources, particularly VUV (vacuum ultraviolet : 157nm) in fabricating a minute
10 circuit for a high integration semiconductor device, photoresist polymers thereof and photoresist compositions containing the same, and preparation processes are also disclosed.

Description of the Related Art

15 In general, a useful photoresist for ArF and VUV has a variety of desired characteristics, such as low light absorbance at the wavelength of 193nm and 157nm, excellent etching resistance, and excellent adhesiveness to a wafer. In addition, a photoresist should be easily developable in a commercially readily available developing solution, such as 2.38wt% and 2.6wt% aqueous tetramethylammonium
20 hydroxide (TMAH) solution.

Recently, much research has been conducted on resins having a high transparency at the wavelength of 248nm and 193nm and dry etching resistance similar to novolac resin. However, most of the photoresists are not suitable for VUV due to their poor transmittance at 157nm wavelength.

25 Research on polyethylene or polyacrylate containing fluorine has also been conducted. Unfortunately, most photoresists containing fluorine with a polyethylene, polystyrene or polyacrylate polymer backbone have weak etching resistance, low solubility in an aqueous TMAH solution and poor adhesiveness to the silicon wafer. In addition, these photoresists are difficult to mass-produce and are expensive.

30 On the other hand, photoresists containing fluorine with alicyclic polymer or maleicanhydride-norbornene polymer backbone have good adhesiveness to the silicon wafer, low light absorbance at the wavelength of 157nm and excellent etching resistance compared to photoresists with polyacrylate backbone.

Besides the above photoresist containing a photoresist polymer, which is prepared by using butadiene sulfone instead of maleicanhydride as a comonomer, has a low light absorbance at the wavelength of 157nm and an excellent etching resistance.

5

SUMMARY OF THE DISCLOSURE

Accordingly, novel photoresist monomers, polymers thereof and photoresist compositions containing the same are disclosed which can be used for a light sources such as ArF (193nm) and VUV (157nm).

Also, a process for forming a photoresist pattern using the photoresist compositions described above and a semiconductor element produced by using the process described above are also disclosed.

10

BRIEF DESCRIPTION OF THE DRAWINGS

20

DETAILED DESCRIPTION OF THE PRESENTLY PREFERRED EMBODIMENTS

A butadiene sulfone compound represented by following Formula 1 used for a photoresist monomer:

25

Formula 1

In addition, a photoresist polymer comprises the compound of Formula 1 as a comonomer. The photoresist polymer comprises a repeating unit represented by following Formula 2 or Formula 3.

Formula 2

Formula 3

wherein, R_1 is selected from the group consisting of H, halogen, (C_1-C_{20}) alkyl, (C_1-C_{20}) alkyl with halogen substituent(s), (C_1-C_{20}) alkyl containing an ether group (-O-), (C_1-C_{20}) alkyl with halogen substituent(s) and containing an ether group, and -COOR';

R_2 , R_3 , R_5 and R_6 are individually selected from the group consisting of H, halogen, (C_1-C_{20}) alkyl, (C_1-C_{20}) alkyl with halogen substituent(s), (C_1-C_{20}) alkyl containing an ether group, and (C_1-C_{20}) alkyl with halogen substituent(s) and containing an ether group;

R' , R_4 and R_7 are individually acid labile protecting groups;

X and Y are individually selected from the group consisting of (C_1-C_{10}) alkylene, O and S;

n is 0 or 1; and

the ratio a : b : c falls within the ranges 1-50mol% : 0-50mol% : 0-80mol%.

Preferably, the above repeating unit comprises one or more of substituent(s) which are selected from the group consisting of halogen, (C₁-C₂₀) alkyl, (C₁-C₂₀) alkyl with halogen substituent(s), (C₁-C₂₀) alkyl containing an ether group, and (C₁-C₂₀) alkyl with halogen substituent(s) and containing an ether group. More preferably, they comprise one or more of substituent(s) which are selected from the group consisting of F, (C₁-C₂₀) alkyl, (C₁-C₂₀) perfluoroalkyl, (C₁-C₂₀) alkyl containing an ether group, (C₁-C₂₀) perfluoroalkyl containing an ether group, (C₁-C₂₀) alkyl partially substituted with F, and (C₁-C₂₀) alkyl partially substituted with F and containing an ether group.

10 In an embodiment, R₂, R₃, R₅ and R₆ are individually selected from the group consisting of H, F, CH₃ and CF₃.

And the acid labile protecting group can be any of known protective groups which prevent the compound from dissolving in an alkaline developing solution. However, under the presence of acid, the acid labile group is substituted with acid, thereby making the compound soluble to the alkaline solution.

Some of conventional acid labile protecting groups are disclosed in US 5,212,043 (May 18, 1993), WO 97/33198 (Sep 12, 1997), WO 96/37526 (Nov 28, 1996), EP 0 794 458 (Sep 10, 1997), EP 0789 278 (Aug 13, 1997), US 6,132,926 (Oct 17, 2000), US 6,143,463 (Nov 7, 2000), US 6,150,069 (Nov 21, 2000), US 6,180,316 B1 (Jan 30, 2001), US 6,225,020 B1 (May 1, 2001), US 6,235,448 B1 (May 22, 2001) and US 6,235,447 B1 (May 22, 2001). Acid labile protecting groups of the present invention are preferably selected from the group consisting of 2-methyl 2-adamantyl, hexafluoro isopropyl, 8-ethyl 8-tricyclodecanyl, tert-butyl, tetrahydropyran-2-yl, 2-methyl tetrahydropyran-2-yl, tetrahydrofuran-2-yl, 2-methyl tetrahydrofuran-2-yl, 1-methoxypropyl, 1-methoxy-1-methylethyl, 1-ethoxypropyl, 1-ethoxy-1-methylethyl, 1-methoxyethyl, 1-ethoxyethyl, tert-butoxyethyl, 1-isobutoxyethyl and 2-acetylmenth-1-yl.

The above repeating unit of Formula 2 or Formula 3 further comprise the following monomer of Formula 4.

Formula 4

wherein, R_8 is selected from the group consisting of H, halogen, (C_1-C_{20}) alkyl, (C_1-C_{20}) alkyl with halogen substituent(s), (C_1-C_{20}) alkyl containing an ether group, and (C_1-C_{20}) alkyl with halogen substituent(s) and containing an ether group;
 5 Z is O or S; and
 m is 0 or 1.

Some of preferred repeating units of above Formula 2 are disclosed, but are not limited to, as following Formulas 2a to 2e:

Formula 2a

Formula 2b

Formula 2c

5

Formula 2d

6

Some of preferred repeating units of above Formula 3 are disclosed, but are not limited to, as following Formula 3a:

Formula 3a

5 The process for preparing of a photoresist polymer comprising the repeating units of Formula 2 or Formula 3 will now be explained in more detail. Radical polymerizing or anion polymerizing each comonomer can prepare the disclosed repeating unit. For example, the repeating unit of Formula 2 can be prepared according to the process comprising:

10 (a) admixing (i) a monomer of Formula 1, (ii) at least one of the monomer selected from the group consisting of Formula 5 and Formula 6, and optionally (iii) a monomer of Formula 4; and

15 (b) adding a radical polymerization initiator into the resultant of step (a) in case of performing radical polymerization; or adding an anion polymerization catalyst into the resultant of step (a) in case of performing anion polymerization .

Formula 5

Formula 6

wherein, R₁ is selected from the group consisting of H, halogen, (C₁-C₂₀) alkyl, (C₁-C₂₀) alkyl with halogen substituent(s), (C₁-C₂₀) alkyl containing an ether group, (C₁-C₂₀) alkyl with halogen substituent(s) and containing an ether group, and - COOR';

R₂ and R₃ are individually selected from the group consisting of H, halogen, (C₁-C₂₀) alkyl, (C₁-C₂₀) alkyl with halogen substituent(s), (C₁-C₂₀) alkyl containing an ether group, and (C₁-C₂₀) alkyl with halogen substituent(s) and containing an ether group;

R' and R₄ are individually acid labile protecting groups;

X and Y are individually selected from the group consisting of (C₁-C₁₀) alkylene, O and S; and

n is 0 or 1.

In addition the repeating unit of Formula 3 can be prepared according to the process comprising:

(a) admixing (i) a monomer of Formula 1, (ii) at least one of the monomer selected from the group consisting of Formula 7 and Formula 8, and optionally (iii) a monomer of Formula 4; and

(b) adding a radical polymerization initiator into the resultant of step (a) in case of performing radical polymerization; or adding an anion polymerization catalyst into the resultant of step (a) in case of performing anion polymerization.

Formula 7

Formula 8

wherein, R_5 and R_6 are individually selected from the group consisting of H, halogen, $(\text{C}_1\text{-C}_{20})$ alkyl, $(\text{C}_1\text{-C}_{20})$ alkyl with halogen substituent(s), $(\text{C}_1\text{-C}_{20})$ alkyl containing an ether group, and $(\text{C}_1\text{-C}_{20})$ alkyl with halogen substituent(s) and containing an ether group; and

R_7 is an acid labile protecting group.

The repeating unit of Formula 3 can be prepared according to the following process as well as polymerizing each comonomer as described above. For example, in case that the repeating unit of Formula 3 only comprises monomers of Formula 1, Formula 7 and Formula 8, the process comprises:

(a) polymerizing a monomer of Formula 1 and 4-acetoxy styrene derivative by radical polymerization or anion polymerization;

(b) hydrolyzing the resultant polymer of step (a) to obtain a polymer of 4-hydroxy styrene monomer of the Formula 8; and

(c) reacting a compound containing acid labile protecting group(R_7) with the resultant of step (b) thereby substituting partial hydrogens of hydroxyl group with acid labile protecting group.

In the above process, radical polymerization or anion polymerization are carried out by bulk polymerization or solution polymerization.

In case that it is carried out by solution polymerization, the organic solvents suitable for polymerization can be cyclohexanone, cyclopentanone, tetrahydrofuran, dimethylformamide, dimethylsulfoxide, dioxane, methylethylketone, benzene, toluene, xylene or mixtures thereof.

The polymerization initiators can be any conventional one, preferably a radical polymerization initiators such as 2,2'-azobisisobutyronitrile(AIBN), benzoyl peroxide, acetyl peroxide, lauryl peroxide, tert-butyl peracetate or di-tert-butyl peroxide.

And the anion polymerization catalyst can be selected from the group consisting of KOH, NaNH₂, alkoxide ion, alkali metal, grignard reagent, and alkyl lithium such as lithium diisopropyl amide or n-BuLi.

More preferably, after polymerization, the repeating unit is subject to crystallization and/or purification by using diethyl ether, petroleum ether, alkane, alcohol, water or mixtures thereof.

A photoresist polymer of the present invention comprises the above repeating unit in the main chain and further comprises other comonomers or additives as occasion demands.

In addition, another aspect of the present invention provides a photoresist composition comprising (i) a photoresist polymer described above; (ii) a photoacid generator; and (iii) an organic solvent.

Any of conventional photoacid generator, which is able to generate acids when it is exposed to light, can be used. Some of conventional photoacid generator are disclosed in US 5,212,043 (May 18, 1993), WO 97/33198 (Sep 12, 1997), WO 96/37526 (Nov 28, 1996), EP 0 794 458 (Sep 10, 1997), EP 0789 278 (Aug 13, 1997) and US 6,132,926 (Oct 17, 2000), US 6,143,463 (Nov 7, 2000), US 6,150,069 (Nov 21, 2000), US 6,180,316 B1 (Jan 30, 2001), US 6,225,020 B1 (May 1, 2001), US 6,235,448 B1 (May 22, 2001) and US 6,235,447 B1 (May 22, 2001).

Preferred photoacid generators have relatively low light absorbance in the wavelength of 157nm and 193nm. More preferred photoacid generator is phthalimidotrifluoromethane sulfonate, dinitrobenzyltosylate, n-decyl disulfone, naphthylimido trifluoromethane sulfonate or mixtures thereof.

10054532-012203
The photoacid generator can further comprise a compound selected from the group consisting of diphenyl iodide hexafluorophosphate, diphenyl iodide hexafluoroarsenate, diphenyl iodide hexafluoroantimonate, diphenyl p-methoxyphenylsulfonium triflate, diphenyl p-toluenylsulfonium triflate, diphenyl p-isobutylphenylsulfonium triflate, diphenyl p-tert-butylphenylsulfonium triflate, triphenylsulfonium hexafluoroarsenate, triphenylsulfonium hexafluoroantimonate, triphenylsulfonium triflate, dibutyl-naphthylsulfonium triflate and mixtures thereof.

Typically, the amount of photoacid generator is from about 0.05 to about 10% by weight of the photoresist polymer employed. It has been found that when the photoacid generator is used in the amount less than about 0.05%, it lowers photosensitivity of the photoresist composition, and when the photoacid generator is used in the amount greater than about 10%, it results in a poor pattern formation due to its high absorption.

On the other hand, any of conventional organic solvent can be employed for this invention and some of the conventional one are also disclosed in the documents described above. Preferred organic solvents for photoresist composition is methyl 3-methoxypropionate, ethyl 3-ethoxypropionate, propylene glycol methyl ether acetate, cyclohexanone, 2-heptanone, ethyl lactate or mixture thereof.

The amount of organic solvent can range from about 500 to about 2000% by weight of the photoresist polymer to coat the photoresist in a wanted thickness. It has been found that when the organic solvent is used in the amount of about 1000wt%, a thickness of the photoresist will be about 0.25 μ m.

The present invention also provides a process for forming a photoresist pattern comprising:

- (a) coating the photoresist composition described above on a substrate to form a photoresist film;
- (b) exposing the photoresist film to light; and
- (c) developing the exposed photoresist film to obtain a photoresist pattern.

The process for forming the photoresist pattern can further include a soft baking which is preformed before the step (b) and/or a post baking step which is preformed after the step (b). Preferably, the soft and post baking steps are performed at temperature ranging from about 70 to about 200°C.

Exemplary light sources which are useful for forming the photoresist pattern include not only VUV but also ArF, KrF, E-beam, EUV or ion beam. Preferably, the irradiation energy in the step (b) is in the range of between about 1mJ/cm² and about 100 mJ/cm².

5 On the other hand, the step (c) can be performed in alkaline developing solution, which is preferably TMAH aqueous solution with a concentration ranging from about 0.01 to about 5wt%.

In addition, another aspect of the present invention provides a semiconductor device manufactured using the photoresist composition described above.

10 The disclosed polymers and photoresist compositions will now be described in more detail by referring to examples below, which are not intended to be limiting.

I. Preparation of Photoresist Polymers

Example 1--Synthesis of poly(butadiene sulfone/norbonene/2-methyl 2-
15 adamantyl trifluoromethyl acrylate)

To 20mL of anhydrous tetrahydrofuran was added butadiene sulfone (0.1mole), norbonene(0.1mole), 2-methyl 2-adamantyl trifluoromethyl acrylate (0.1mole) and AIBN(0.3g), and the resulting solution was reacted at about 65°C for about 10 hours. Thereafter, a polymer was precipitated and filtered in mixture solution of methanol
20 and water, thereby obtaining the entitled polymer of Formula 2a (yield : 67%).

Example 2--Synthesis of poly(butadiene sulfone/tert-butyl-5-norbonene-2-
carboxylate/hexafluoroisopropyl trifluoromethyl acrylate)

To 25mL of tetrahydrofuran was added butadiene sulfone (0.1mole), tert-butyl-5-norbonene-2-carboxylate (0.1mole), hexafluoroisopropyl trifluoromethyl acrylate
25 (0.1mole) and AIBN(0.5g), and the resulting solution was reacted at about 65°C for about 10 hours. Thereafter, a polymer was precipitated and filtered in mixture solution of methanol and water, thereby obtaining the entitled polymer of Formula 2b (yield : 56%).

Example 3--Synthesis of poly(butadiene sulfone/tert-butyl-5-norbonene-2-
30 carboxylate/hexafluoroisopropyl methacrylate)

To 25mL of tetrahydrofuran was added butadiene sulfone (0.1mole), tert-butyl-5-norbonene-2-carboxylate (0.1mole), hexafluoroisopropyl methacrylate (0.1mole)

and AIBN(0.5g), and the resulting solution was reacted at about 65°C for about 10 hours. Thereafter, a polymer was precipitated and filtered in mixture solution of methanol and water, thereby obtaining the entitled polymer of Formula 2c (yield : 56%).

5 Example 4--Synthesis of poly(methyl maleimide/butadiene sulfone/tert-butyl-5-norbonene-2-carboxylate/hexafluoroisopropyl methacrylate)

To 25mL of tetrahydrofuran was added methyl maleimide (50mL), butadiene sulfone (0.1mole), tert-butyl-5-norbonene-2-carboxylate (0.1mole), hexafluoroisopropyl methacrylate (0.1mole) and AIBN(0.5g), and the resulting
10 solution was reacted at about 65°C for about 10 hours. Thereafter, a polymer was precipitated and filtered in mixture solution of methanol and water, thereby obtaining the entitled polymer of Formula 2d (yield : 56%).

Example 5--Synthesis of poly(butadiene sulfone/4-ethoxyethoxy styrene/4-hydroxy styrene)

15 (Stage 1) Synthesis of poly(butadiene sulfone/4-acetoxy styrene)

To 20mL of anhydrous tetrahydrofuran was added butadiene sulfone (0.1mole), 4-acetoxy styrene(0.15mole) and AIBN(0.3g), and was passed through nitrogen thereby removing general air. And the resulting solution was shielded thoroughly and reacted at about 90°C for about 10 hours. Thereafter, a polymer was
20 precipitated and filtered in mixture solution of methanol and water, thereby obtaining the entitled compound (yield : 56%).

(Stage 2) Synthesis of poly(butadiene sulfone/4-hydroxy styrene)

To mixture solution which is 20mL of methanol and 30mL of 1N hydrochloric acid was added poly(butadiene sulfone/4-acetoxy styrene) obtained from Stage
25 1(0.05mole). And the resulting solution was reacted at about 50°C for about 10hours, thereby obtaining the entitled compound (yield : 95%).

(Stage 3) Synthesis of poly(butadiene sulfone/4-ethoxyethoxy styrene/4-hydroxy styrene)

To 10mL of tetrahydrofuran was added poly(butadiene sulfone /4-hydroxy
30 styrene) obtained from Stage 2(0.04mole) and sulfuric acid(0.1mL), and the resulting solution was stirred at room temperature for about 10 minutes. And then ethylvinylether was injected a reactor containing the resulting solution and stirred for

about 10 hours. Thereafter, a polymer was precipitated and filtered in mixture solution of methanol and water, thereby obtaining the entitled compound substituted partial hydrogens of hydroxyl group with ethoxyethyl which is acid labile protecting group(yield : 92%).

5

II. Preparation of Photoresist Compositions and Formation of Patterns

Example 6--Preparation of photoresist compositions and formation of patterns(1)

To 100g of propylene glycol methyl ether acetate(PGMEA) was added 10g of the photoresist polymer obtained from Example 1, 0.06g of phthalimidotrifluoromethane sulfonate, and 0.06g of triphenylsulfonium triflate. The polymer was precipitated and filtered in 0.20 μ m filter to obtain a photoresist composition.

The photoresist composition thus prepared was spin-coated on silicon wafer to form a photoresist film, and soft-baked at about 110°C for about 90 seconds. After baking, the photoresist was exposed to light using a ArF laser exposer, and then post-baked at about 110°C for about 90 seconds. When the post-baking was completed, it was developed in 2.38wt% aqueous TMAH solution for about 40 seconds, to obtain 0.12 μ m L/S pattern (see Figure 1).

Example 7--Preparation of photoresist compositions and formation of patterns(2)

To 100g of propylene glycol methyl ether acetate(PGMEA) was added 10g of the photoresist polymer obtained from Example 2, 0.06g of phthalimidotrifluoromethane sulfonate, and 0.06g of triphenylsulfonium triflate. The polymer was precipitated and filtered in 0.20 μ m filter to obtain a photoresist composition.

The photoresist composition thus prepared was spin-coated on silicon wafer to form a photoresist film, and soft-baked at about 110°C for about 90 seconds. After baking, the photoresist was exposed to light using a ArF laser exposer, and then post-baked at about 110°C for about 90 seconds. When the post-baking was completed, it was developed in 2.38wt% aqueous TMAH solution for about 40 seconds, to obtain 0.13 μ m L/S pattern (see Figure 2).

Example 8--Preparation of photoresist compositions and formation of patterns(3)

To 100g of propylene glycol methyl ether acetate(PGMEA) was added 10g of the photoresist polymer obtained from Example 3, 0.06g of
5 phthalimidotrifluoromethane sulfonate, and 0.06g of triphenylsulfonium triflate. The polymer was precipitated and filtered in 0.20 μ m filter to obtain a photoresist composition.

The photoresist composition thus prepared was spin-coated on silicon wafer to form a photoresist film, and soft-baked at about 110°C for about 90 seconds. After
10 baking, the photoresist was exposed to light using a ArF laser exposer, and then post-baked at about 110°C for about 90 seconds. When the post-baking was completed, it was developed in 2.38wt% aqueous TMAH solution for about 40 seconds, to obtain 0.12 μ m L/S pattern (see Figure 3). ✓

Example 9--Preparation of photoresist compositions and formation of patterns(4)

To 100g of propylene glycol methyl ether acetate(PGMEA) was added 10g of the photoresist polymer obtained from Example 4, 0.06g of
15 phthalimidotrifluoromethane sulfonate, and 0.06g of triphenylsulfonium triflate. The polymer was precipitated and filtered in 0.20 μ m filter to obtain a photoresist
20 composition.

The photoresist composition thus prepared was spin-coated on silicon wafer to form a photoresist film, and soft-baked at about 110°C for about 90 seconds. After
baking, the photoresist was exposed to light using a ArF laser exposer, and then post-baked at about 110°C for about 90 seconds. When the post-baking was completed, it
25 was developed in 2.38wt% aqueous TMAH solution for about 40 seconds, to obtain 0.13 μ m L/S pattern (see Figure 4). ✓

Example 10--Preparation of photoresist compositions and formation of patterns(5)

To 100g of propylene glycol methyl ether acetate(PGMEA) was added 10g of
30 the photoresist polymer obtained from Example 5, 0.06g of phthalimidotrifluoromethane sulfonate, and 0.06g of triphenylsulfonium triflate.

The polymer was precipitated and filtered in 0.20 μ m filter to obtain a photoresist composition.

The photoresist composition thus prepared was spin-coated on silicon wafer to form a photoresist film, and soft-baked at about 110°C for about 90 seconds. After baking, the photoresist was exposed to light using a ArF laser exposers, and then post-baked at about 110°C for about 90 seconds. When the post-baking was completed, it was developed in 2.38wt% aqueous TMAH solution for about 40 seconds, to obtain 0.13 μ m L/S pattern (see Figure 5).

Experimental example--Examination of absorbance at 157nm

Absorbance of photoresist composition obtained from Example 6 coated in a thickness of 2500Å was shown by VUV spectrum of Figure 6. According to Figure 6, the absorbance of the photoresist composition of Example 6 at 157nm wavelength was 0.25, which was merely a half of the absorbance of conventional photoresist for KrF or ArF light source at 157nm. Thus, the conventional photoresist composition should be coated in a thickness of 600~700Å or less to satisfy the requisite of light transmittance for a lithography process employing 157nm light source, while the photoresist composition according to the present invention, having high light transmittance for 157nm light source, can provide efficient pattern even when it coated in a thickness of 1200 Å or more.

The photoresist composition according to the present invention ensures enhanced etching resistance, as it allows formation of photoresist film in a sufficient thickness.

From Experimental Example, it is noticed that the composition comprising the photoresist polymer according to the present invention has excellent light transmittance at 157nm wavelength, so that it can be usefully employed for a photolithography process using 157nm light source. In addition, from Examples 6 to 10, it is ascertained that the photoresist composition comprising the photoresist polymer according to the present invention has effective physical property as a photoresist.

As discussed earlier, a photoresist pattern having excellent durability, etching resistance, and developable property can be formed successfully by employing the photoresist composition of this present invention. And the photoresist composition

of this present invention can be used in forming a minute pattern below 1G DRAM as well as 4G and 16G. Moreover, the photoresist polymer of this present invention has a low light absorbance at the 157nm wavelength, and thus is suitable for a photolithography using VUV.
